

The Bukkehave team is your partner for fleet solutions in emerging markets

Serving international construction projects in the developing world

With over 85 years of experience in serving international organizations in emerging markets, we deliver customized fleet solutions to companies who operate and manage international construction projects in the developing world. Our expertise is built on decades of experience in providing trucks, vehicles, equipment, and maintenance services to international organizations in emerging markets. We utilize our unique position to deliver significant value to international construction projects by minimizing costs, optimizing vehicle fleet utilization and managing daily activities efficiently.

What does Bukkehave offer to international construction projects in the developing world?

Bukkehave offers purpose-built solutions for the vehicle fleet needs of construction projects in remote areas of the world. We offer and incorporate unique fleet solutions for projects such as highway construction, power generation, dams and LNG projects to name just a few. Many of our clients' projects are located in developing countries away from major cities and infrastructure. These are the very projects in which we excel. We make it easy for our clients to focus on their construction project while we use our expertise to focus on providing fleet services. Fleet solutions are dependent on the unique attributes of each project and are developed to meet specific needs. Solutions typically incorporate factors such as: truck, vehicle and equipment supply; maintenance and service; fleet and supply chain operations; supply chain management; logistics; reduction in fleet costs; fleet analysis and training. And we do all of this on-site at the project level, while coordinating with the project owners at the headquarter level.

Who do we serve?

International construction projects

What do we offer?

Vehicle fleet solutions

Where do we operate?

Emerging markets

When is the best time?

Right now

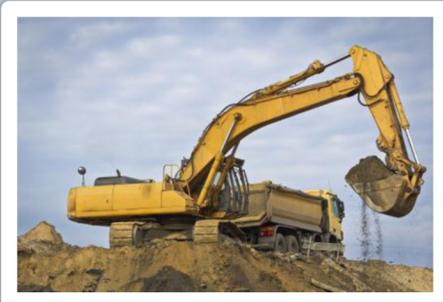

Why do we do all this?

We have the knowledge, desire, experience, capability and resources

What are some of the challenges construction projects face in the developing world?

We have learned that our clients are experts in international construction. However, they need partners who can support their projects fleet needs. One of the greatest challenges experienced by operations is having the right fleet of trucks, vehicles and equipment in place and fully operational when needed. Thus, fleet management takes on more importance when up-time and equipment capability are critical to keeping a project on-time and under budget. For example, when operating a construction project in a developing country, it is critical to have haul trucks operational to move material, an operational bus fleet to bring in workers, and light vehicles for management. Every piece of equipment must be right for the job, maintained and serviced to keep the project moving forward, all at the lowest overall cost. This is where Bukkehave delivers the greatest value. We take on these challenges for international construction projects in developing countries and know how to minimize costs while delivering the highest value vehicle fleet solutions.

Who does Bukkehave serve in the international construction project?

We work with companies who have international construction projects in the developing world and who typically are headquartered in the developed world. They pursue projects outside of their own countries, including in developing markets. For example, most of our clients take on construction projects financed by various government entities and global financial institutions. We work with construction projects big and small to develop, implement and fulfill their specific vehicle fleet needs.

In what phase of a construction project does Bukkehave offer the best service?

While 'now' is always the right time to get started, we provide the best service to construction projects by participating in the pre-construction phase, feasibility phase and construction phase. We are involved throughout the entire project life, and welcome the opportunity to discuss project needs early in the process to develop the optimal fleet solution. For projects that have financing in place or have already begun, we are ready to get started immediately.
